

PRODUCT CATEGORY - DRESSINGS

Foam Dressings

Foam dressings are sheets and other shapes of foamed polymer solutions (most commonly polyurethane) with small, open cells capable of holding fluids. They may be impregnated or layered in combination with other materials. Absorption capability depends on thickness and composition. The area in contact with the wound surface is non-adhesive for easy removal. Available with an adhesive border and/or a transparent film coating that acts as a bacterial barrier. Indicated for partial- and full-thickness wounds.
